EDUCATION

Queen's University Belfast
2022 - 2026
BEng Software Engineering

Relevant modules

- Data Structures and Algorithms (2:1)
- Procedural Programming (1st)
- Object Oriented Programming (1st)
- Databases (2:1)
- Service-Oriented Programming (2:1)
- Cloud Computing (1st)

TECHNICAL SKILLS

- C# (.NET, EF Core)
- Javascript (Vue, Backbone)
- SQL (MS SQL Server, PostgreSQL)
- Java
- CSS and UX Design
- Git
- Playwright Automated Testing
- QA

OTHER RELEVANT SKILLS / ACHIEVEMENTS

- Strong Communication Skills
- Collaboration and Teamworking
- Problem Solver
- 578 points Leaving Certificate
- 2018, Two Academic Awards of Excellence
- 2017, Corn Shéamuis Mhic Géidigh, for leadership
- Full UK Driving License
- Bilingual (Gaeilge)

PERSONAL PROFILE

I am a highly motivated Software Engineer in my final year of study at Queen's University Belfast. I am currently working part-time at EventMAP while completing my studies to continue gaining professional development experience alongside my university curriculum. I am passionate about my area of study, always striving to explore and learn about new technologies while also improving my fundamental skills as a developer. My enthusiasm and skills are reflected in my everyday work and the projects I have completed to date.

WORK EXPERIENCE

EventMAP Solutions
Part-time Software Engineer — **August 2025 - Present**

Continued working part-time during my final year following placement, contributing to feature development and bug fixes, as well as maintaining and developing automated tests. Remained actively involved in development cycles, supporting a new placement student while ensuring code quality and familiarity with the codebase.

EventMAP Solutions
Placement Software Engineer — **May 2024 - August 2025**

Gained professional experience working as a full-stack Placement Software Engineer working across two major web applications within the Optime suite. Optime Ceremonies, a graduation ceremony management tool and Optime Exam, an exam scheduling application. As part of this role I developed and maintained backend services built on the .NET framework using C# and Entity Framework Core, alongside primarily Vue.js for frontend development. I contributed to identifying critical functionality workflows across both applications and using the Playwright framework, I implemented both E2E tests and API tests, improving overall test coverage across both applications.

As well as development experience, I worked alongside the Customer Support team. I worked directly with client representatives investigating potential issues, resolving queries and providing general support across both applications in a professional, timely manner. Further, I contributed to the Quality Assurance team, testing upcoming releases to ensure stability and preventing the introduction of new bugs.

PERSONAL PROJECTS

Progress Tracker Web Application

I created this project for my friends and I as a way to manage our university assignments and easily visualise our progress from a user friendly dashboard. I developed this during the beginning of my placement as a way to deepen my learning about web development and gain more familiarity with C# and Entity framework core. It integrates with Instructure Canvas' API in order to fetch assignments across all modules and automatically populate the application, storing the data in a PostgreSQL database. I learned a great deal about the architecture of web applications and was a useful way to apply and build on the knowledge gained throughout my placement.

Interactive Java Library Application

This was a project I completed in my second semester. Using UML I designed the architecture and then implemented it using Java. It had a simple console based UI capable of managing data on library books. This project helped reinforce the concepts of polymorphism and inheritance while learning about them in class.
